Database Query Revision Summary

The CourseObj class was reworked because CourseObj attributes were being indexed incorrectly. This change also allows for a more organized way of storing information for each course rather than having just the output given by the query. A printCourseInfo was also implemented in CourseObj to clearly display the course info for a given class. In addition to the CourseObj changes, the connection method was moved inside the CourseQuery class and also created a method that creates a list of CourseObjs. By implementing the connect method within the CourseQuery class, "connection" does not have to be passed connection in as a parameter for every method call inside datasource.py. Ultimately, the changes were focused on improving the data storage, data output, and reducing parameters passed in methods.
